Art Unit: 2818

## **DETAILED ACTION**

## Information Disclosure Statement

- 1. This office acknowledges receipt of the following items from the applicant:
  - Information Disclosure Statement (IDS), filed on July 1, 2002.

## Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 3. Claims 1-20 are rejected under 35 U.S.C. 102(b) as being anticipated by Holst (U.S. Pat. No. 6,188,596).

Regarding claim 1, Holst disclose a semiconductor memory device comprising: a global data line (figure 2, global bit-line pairs 152); a plurality of primary sense amps connected to the global data line and also connected to bitlines (figure 2, primary sense amps 151 connected to the global bit-line pair 152 and also to the local bit-lines; col. 5, lines 8+), each of which is coupled to an array of memory storage cells (figure 3, memory cells 301) which are selected for write and read operations by a plurality of wordlines (figure 2); a single secondary sense amp (secondary sense amp 130) connected to the global data line, wherein the secondary sense amp receives data from the primary sense amps over the global data line, and includes a restore /writeback circuit (write circuit) to writeback data over the global data line to a primary sense amp and back into the memory (figure 2, col. 6, lines 5+ and its related description).

Art Unit: 2818

Regarding claim 2, Holst discloses the circuit comprising all of the limitation as of claim 1, wherein the secondary sense amp includes a latch (figure 5).

Regarding claim 3, Holst discloses the circuit comprising all of the limitation as of claim 1, wherein each primary sense amp includes at least one direct sense device, and only the gate of each direct sense device is connected to a bitline, such that the direct sense device does not provide any feedback to or alter the signal on the bitline (figure 4).

Regarding claims 4-5, Holst discloses the circuit comprising all of the limitation as of claim 1, wherein each primary sense amp includes: a pair of precharge/equalize devices, coupled between a power supply and a pair of bitlines; a pair of write switch devices, coupled between the global data line and the pair of respective bitlines; a pair of read devices, coupled between the pair of respective bitlines and the global data line; a pair of read enable switch devices, coupled in series with the pair of respective read devices and ground (figures 2, 4).

Regarding claim 13, Holst discloses the circuit comprising all of the limitation as of claim 1, wherein during a 2-cycle memory read and refresh operation, in a first memory read cycle data is transferred from one array in the memory through a primary sense amp to the secondary sense amp which is multiplexed and shared between the plurality of primary sense amps, and in a second memory refresh cycle data is transferred from the secondary sense amp to a selected primary sense amp back to the one array in the memory (col. 6, lines 5+).

Regarding claim 14, Holst discloses the circuit comprising all of the limitation as of claim 13, wherein during the 2 cycle memory write refresh operation, the wordline remains active for 2-cycles with no interim reset (col. 6, lines 5+).

Art Unit: 2818

Regarding claim 15, Holst discloses the circuit comprising all of the limitation as of claim 14, wherein in the first cycle a primary sense amp senses the data on a bitline, and transfers the data over the global data line as an analog level signal to a latch in the multiplexed secondary sense amp which digitizes the data, and in the second cycle the digitized data is returned over the global data line as a full-rail digital signal back to the primary sense amp which writes the data back into the memory array (col. 5, lines 55+).

Regarding claim 16, Holst discloses the circuit comprising all of the limitation as of claim 1, wherein in the first cycle a primary sense amp senses the data on a bitline, and transfers the data over the global data line as an analog level signal to a latch in the multiplexed secondary sense amp which digitizes the data, and in the second cycle the digitized data is returned over the global data line as a full-rail digital signal back to the primary sense amp which writes the data back into the memory array (col. 5, lines 55+).

Regarding claims 17 and 19, Holst discloses a primary sense amp comprising: a precharge/equalize device, coupled between a power supply and a bitline; a write device, coupled between the global data line, and the bitline; a read device, coupled between the bitline and the global data line; a read enable/switch device, coupled in series with the read device and ground; an inverter coupled between the global data line and the write device, such that inverted digitized data on the global data line is inverted and directed through the write device (see figures 2, 4).

Regarding claim 18 and 20, Holst discloses the sense amplifier circuit comprising all of the limitation as of claim 17 and 19, respectively, wherein the power supply for the inverter is switched off during a read operation, and powered on during a write operation (col. 9, lines 4+).

Art Unit: 2818

Allowable Subject Matter

Page 5

4. Claims 6-12 are objected to as being dependent upon a rejected base claim, but would be

allowable if rewritten in independent form including all of the limitations of the base claim and

any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter:

The prior art of record does not show or suggest, in addition to other element in the claim,

claiming the specific structure arrangement as claimed in claims 6-12. The secondary sense

amplifier of independent claim 1 and its specific components and their interconnection as

claimed in claims 6-12.

**Conclusion** 

5. Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Gene N Auduong whose telephone number is (703) 305-1343.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, David Nelms can be reached on (703) 308-4910. The fax phone numbers for the

organization where this application or proceeding is assigned are (703) 872-9318 for regular

communications and (703) 872-9319 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding

should be directed to the receptionist whose telephone number is (703) 308-0956.
